# Qualifications and Limitations

- The information contained in this presentation is for discussion purposes only and should not to be relied on by its recipients
- The data contained in this presentation are for illustrative purposes only. Actual results for any specific situation might differ
- This presentation is intended for state regulators attending the 2013 Southeastern Regulators Association Conference

# Long-Term Care is a Complex Product

- Pricing is on a lifetime basis (level premium, increasing age curve), and major factors affect the rates:
  - Morbidity - made up of: frequency (probability of starting a claim), continuance curves (probability of person staying on claim – determines length of claim), and utilization (average cost per service and number/mix of services)
  - Lapse and mortality – determines how many people get to durations when claims are high
  - Investment income – determines how much money is made on large reserves that are accumulating
- For all companies – lapse, mortality, and investment income have been declining in recent years

# Is LTC An Insurable Risk?

- Uninsurable risk – where money trades hands and/or risk is completely unpredictable (e.g., Medicare Part B deductible)
- LTC is a low frequency, high cost event...the very definition of an insurable event
- Milliman studies indicate that around 50 percent of insureds who qualify for an LTC policy and hold onto their policies will have a claimable event at some point in their lives (percent varies significantly by age, gender, marital status, etc.)
- For someone to self-insure, significant asset build-up would be needed
- LTC is an insurable event, though it's very complex to price
- Alternatives?

# Top Individual Writers

## 2004 Top Writers

<u>Rank</u>	<u>Company</u>	<u>Production (\$millions)</u>
1	Genworth	153
2	John Hancock	114
3	MetLife	86

# Changes in Carrier Landscape

## Out of market since 2004:

MetLife

Allianz

UNUM

Lincoln Benefit

Penn Treaty

Physicians Mutual

Equitable L&C

State Life

Kanawha

AFLAC

## Newly departed:

Prudential

CUNA Mutual

AIG

American Fidelity

Berkshire

American General

Humana

Physicians Mutual

## Back in the market:

- Thrivent

- Aegon

Source: Broker World Surveys

# What Has Caused the Turmoil?

- Lapse rates—very low, less than 1%
- Interest rates—very low, 3% to 4% new money
- Mortality—extremely low
- Morbidity—claims quite close for some, very high for others

# 2012 Sales Characteristics

- Estimated 2012 sales: \$564.6 million premium, 233,222 policies; 5% increase in premium and 1% increase in policies over 2011
- Top two insurers wrote 60% of the business
- Significant rate increases and discontinuance of some features/options
- Introduction of gender-based rates; Four planned for 2013 with others considering this introduction
- Average premium was \$2,445
- Most sales were comprehensive, TQ, reimbursement

Source: 2013 Broker World Survey

## 2012 Sales Characteristics (cont.)

- Average issue age 56.3 (vs. 61.3 in 2004)
- 56.2% compound, inflation protection, 6.8% simple inflation, 20.3% future purchase option, 6.6% other, 9.9% no inflation
- 19.9% lifetime benefit period (up from 12.7% in 2012-due to one carrier, but down from 32.2% in 2004)
- 92.2% 84+ day elimination period (up from 12.7% in 2012-due to one carrier, but down from 32.2% in 2004)
- 10.7% of new premium in multi-life situations (excluding AARP)

Source: 2013 Broker World Survey

# Policy Features With Most Risk

- Lifetime benefit period
- Short elimination periods
- Cash benefits
- Compound inflation, due to greater build-up of reserves and therefore susceptibility to investment income and low lapses

# Economics of LTCI

- Lifetime loss ratio target of 55 percent – 60 percent:
  - Level issue-age premium
  - Steep morbidity curve – similar to mortality
  - Deferred benefit – very low loss ratios for many years
- Heaped commissions
  - First year cash flow drain

## Economics of LTCL (cont.)

- Low lapse rates
- Conservative statutory reserve standards (revised in 2004)
- Significant risk-based capital requirements (RBC)
- Commissions, reserves, and RBC all lead to early duration statutory surplus strain

## Illustrative Example

### Base Assumptions - Expected Durational Profits 20 Percent Profit Premiums – All Ages Combined

Item	No Inflation – Policy Year						Lifetime @ 5.25%
	1	2	3	4	10

<b>Premium Change Needed</b>	<b>24.4</b>	<b>28.3</b>	<b>30.3</b>	<b>27.2%</b>
<b>Pre-Tax Profit (With Inflation)</b>	<b>4.9</b>	<b>5.3</b>	<b>7.8</b>	<b>5.1%</b>
<b>Premium Change Needed</b>	<b>25.9</b>	<b>26.8</b>	<b>26.1</b>	<b>25.9%</b>

\* Assuming “moderate” was priced for

Source: Internal Milliman Study

# Example of Lifetime Pricing Effect for Sample Company

- Original pricing done 15 years ago (1997)
- Original investment earnings rate = 6.9 percent
- Current investment earnings rate = 4.5 percent
- Original ultimate lapse rate = 4.75 percent
- Current ultimate lapse rate = 1.0 percent
- Morbidity 10 percent higher than originally assumed

Source: Internal Milliman Study

# Effect of Revised Assumptions on Lifetime Profits

Age Band	Original Pre-tax Profit % of Premium @ 6.9%	Original Statutory IRR	Revised Pre-tax Profit % of Premium @ 4.5%	Revised Statutory IRR
<b>55-59</b>	<b>31.8%</b>	<b>15.2%</b>	<b>-32.3%</b>	<b>-0.5%</b>
<b>65-69</b>	<b>21.2%</b>	<b>15.0%</b>	<b>-20.5%</b>	<b>-2.3%</b>
<b>75-79</b>	<b>13.2%</b>	<b>14.4%</b>	<b>-7.0%</b>	<b>-1.6%</b>
<b>All</b>	<b>25.1%</b>	<b>15.1%</b>	<b>-24.8%</b>	<b>-0.9%</b>
<b>Cumulative loss ratio through 15 durations, at ii rate</b>	<b>24.9%</b>		<b>33.2%</b>	
<b>Lifetime loss ratio at 4.0%</b>	<b>62.3%</b>		<b>104.6%</b>	

Source: Internal Milliman Study

# Illustrative Example

## Other Factors Affecting Profits

- Male/female split assumed and/or where it's applied
- Age distribution
- Distribution by benefit period (BP) and/or EP
- Percent of insureds that are married
- Spouse and/or preferred risk discounts
- Average policy size
- Expenses varying by age
- Reserve assumptions
- Margins for adverse deviation
- Salvage on maximum benefits

Source: Internal Milliman Study

# Why the Turmoil?

## Based on Companies leaving the market:

- Lapse rates, interest rates, & mortality: low
- Morbidity - claims quite close to pricing for some, very far off for others (depending on aggressiveness of original pricing and on underwriting)
- Concerns about profitability and being able to get rate increases
- Felt that capital was better invested elsewhere (would yield more immediate results)

# Why the Turmoil? (cont.)

Based on Producer concerns:

- Rate increases and fewer company choices
- Product complexity
- Rates on new products 40%+ above levels available five years ago

# LIMRA 2012 LTC Opinion Survey

- 47 percent out of 83 people expect strong to moderate growth going forward
- 75 percent projected strong to moderate growth for life combos and 66 percent for annuity combos
- Demographics, greater consumer awareness and need for the product are biggest reasons for optimism
- Industry stability and the economy (interest rates) are biggest reasons for pessimism
- 75 percent believe Medicare and Medicaid will NOT offer more benefits in next 20 years
- To increase the market, the products need to be made more affordable and simplified

# Summary

- Premiums have increased, due in part to updated lapse assumptions and interest
- Rates have stabilized, but there are still significant differences in market premiums
- Product is capital intensive and still relatively risky
- But...demographics are hard to ignore, companies will likely enter/stay in the market accordingly
- So is there a better way to address the need?
